
Appendix D1: Evaluation Criteria

This appendix outlines the evaluation criteria to be applied during the various test cycles.

Once the results from each test cycle have been collected, they must be assessed in order to determine performance. This activity includes comparing expected results files with actual results. In addition, this activity involves assessing the coverage and accuracy of all test conditions within a test cycle. Those failing validation must be re-tested during the next cycle. If a significant number of test conditions fail or are not covered during a specific cycle, the test cycle will be rescheduled for execution following the implementation of the appropriate corrective measures.

Both transactional testing and operational analysis require evaluation criteria to assess test results. Test evaluation criteria provides the basis for determining whether an individual test event meets stated objectives and achieves expected results. This activity serves to sharpen the test approach and scope by defining the specific criteria required to measure the success of each test event.

Evaluation criteria are defined for each test to determine whether the results deviate from expectations. In those cases where results deviate, analysis is undertaken to determine the significance of the deviation.

The following table contains metrics that will be gathered from transactional testing and operational analysis. The BellSouth Service Quality Measurements Regional Performance Reports contain BellSouth performance measurement data which will be utilized during the test. This document is available from the BellSouth Web site.

For those areas lacking an existing performance measurement approved by the Georgia PSC, KPMG has developed a set of process and function evaluation criteria that will be used to evaluate the functional and transactional elements of BellSouth's OSS interfaces and processes. During test design, KPMG will further develop the appropriate metrics and standards of performance. These evaluation criteria and may be applied to all instances of a test execution or to a sampling of instances. The volume tests are an example of where a sampling of test transactions would be appropriate to ensure the integrity and content of the transaction data while testing the capacity of BellSouth's application software and infrastructure.
